

Gregory M. Laurent

Technical Strategy · Applied R&D · Platform & Product Leadership

📞 775.300.9291

📍 Reno, NV

✉️ greg@abmac.io

Twenty-year career with progressively broader responsibility in engineering, applied R&D, platform modernization, product strategy, and commercialization. Track record includes **\$1.5M in SBIR proposal awards and research-driven earnings, first production delivery of a stalled enterprise data platform, and zero-downtime modernization of a legacy integration layer handling millions of daily transactions.** Now applying this experience through Abstract Machines, leading technical strategy, feasibility, and commercialization across organizations.

Experience

Founder & Principal

Nov 2023 — Current

Abstract Machines

Founded firm to lead clients' technical strategy, feasibility, applied R&D, productization, and commercialization.

Reno, NV (Remote)

Technical Discovery: Developed and operationalized a technical discovery methodology combining R&D, prototyping, and product planning, enabling larger, more complex client engagements and contributing *\$550K in additional revenue.*

Marketing Attribution R&D: Researched, prototyped, and refined a client's marketing attribution model concept; supported patent filings.

Leak Detection Feasibility: Helped guide designs for an early subterranean leak-detection proof of concept and estimate long-term development to market.

Product Strategy: Owned client roadmap decisions on technical architecture, feasibility, sequencing, and investment tradeoffs, aligning strategy with commercialization goals.

Engineering & Product Leadership: Led engineering and product decisions across engagements, aligning delivery priorities and strengthening planning and governance; trained product managers on execution and decision frameworks.

Product Manager

May 2022 — Dec 2023

PROS

Owned PROS B2B Data Management strategy, roadmap, cross-product integration, and company-wide data infrastructure modernization.

Houston, TX (Remote)

Platform Leadership: Aligned platform priorities with architects and four engineering managers across 30+ personnel in engineering, sales, product, and customer organizations.

Platform Delivery: Turned around a multi-year stalled data platform, leading the team to its first production deployment.

Platform Economics: Cut total platform costs by 94%, saving approximately \$600K annually; tracked usage-based costs to guide packaging and protect margins.

Data Quality: Improved data-quality reporting, cutting support person-hours by 40% for the same workload.

Process Governance: Partnered with the VP of Product to establish company-wide product planning, estimation, and governance standards.

Sr. Software Engineer

Sep 2018 — May 2022

Loomis - US

Houston, TX (Remote)

Owned and built the integration layer moving millions of transactions totaling \$1B daily across SafePoint's retail cash-deposit and provisional-credit platform.

Platform Modernization: Re-architected the critical integration layer, achieving zero-downtime migration, zero-second cutover, and self-healing recovery.

Systems Integration: Engineered bit-perfect, fully recoverable synchronization between incompatible databases, removing a critical modernization blocker.

Operational Improvement: Defined onboarding requirements, implemented automation and integrations, and raised Customer Support productivity over 60% without added headcount.

Risk Management: Assessed risk and defined rollout and recovery plans with stakeholders; helped architect and implement an event-driven platform integrating legacy systems.

Technical Lead

May 2010 — Sep 2018

Progeny Systems

Las Vegas, NV

Led three teams across DoD SBIR research, prototyping, and productization, with outcomes enabling Phase III commercialization and DoD adoption.

SBIR Capture & Commercialization: Individually generated \$1M in SBIR funding (2016–2018) across three Phase I/II awards. Productized a first-of-its-kind mobile application integrating Naval Fuel Depot asset management with IBM Maximo.

SBIR Proposal Development: Primarily authored an awarded Phase I proposal and guided technical product development for Naval health information ashore and afloat; additional awarded work supported mobile tools and training for Naval galleys.

Applied Research & Commercialization: Developed schematic-symbol recognition, tracing, and classification algorithms and an image-processing engine for interactive canvases. This Phase I/II SBIR R&D enabled Phase III commercialization and DoD adoption.

R&D Engineering Leadership: Led and mentored developers across three concurrent DoD R&D teams, training them on secure integration and DoD software requirements.
